Average of Numbers in an AP

7th 8th 9th 13th
6 × 5 = 30
d = 5

2nd 3 terms 5th

- Average of numbers in AP = Middle term = $\frac{\text{First} + \text{Last}}{2} = \frac{\text{Second} + \text{Second-last}}{2}$ and so on.

4+1 = 5
5 − 1 = 4

30, 40, 50, 60, 70

30, 40, 50, 60, 70, 80

- If there are n terms in AP, the average will be at $\left(\frac{n+1}{2}\right)^{th}$ position.

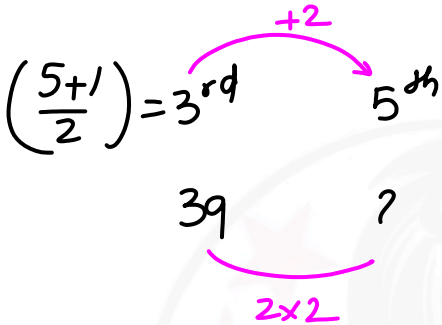

e.g 5 terms → $\left(\frac{5+1}{2}\right)^{th} = 3^{rd}$

$\left(\frac{6+1}{2}\right)^{th} = 3.5^{th}$

↳ middle term position

- Number of terms in an AP = $\frac{\text{Last term} - \text{First term}}{\text{Common difference}} + 1$

- The difference between m^{th} & n^{th} term of an AP $(m > n)$ is $(m-n)d$.
  d = common difference
